CHALMERS

Outline

- Motivation
- CONT08 results
- CONT11 results (preliminary)
- Conclusions
- Outlook for VLBI2010

Motivation

- National Metrological Institutes (NMI) realize UTC(k)
- Operate ensembles of frequency standards such as cesium clocks, cesium fountains, hydrogen masers, etc.
- Are recommended to realize $\text{UTC} \pm 100 \text{ ns}$
- Most laboratories do this much better, SP aims as $\pm 5 \text{ ns}$
- Need to repeatedly compare time information with other international NMIs
- Use various redundant methods, e.g. two-way satellite time and frequency transfer (TWSTFT), GNSS (common view, all-in-view), optical fibre,...
- Can VLBI be an interesting alternative?

Some previous work

Author	main result
Clark <i>et al.</i> (1977)	clock synchronization using VLBI, ns level
Hurd <i>et al.</i> (1978)	1e-13 link stability, 1e-14 possible
Spencer <i>et al.</i> (1981)	5 ns in time, rate uncertainty 1.3e-14
Johnston <i>et al.</i> (1983)	MARK III calibration, sub-nanoseconds
Ward (1984)	clock synchronization using VLBI
Yoshino <i>et al.</i> (1984)	short baseline (SBI) calibration, precision < 1 ns
Hama <i>et al.</i> (1989)	zero baseline calibration (ZBI) with ns accuracy
Takiguchi <i>et al.</i> (2007, 2008)	frequency link uncertainty < 1e-15 @ 1 day
Rieck <i>et al.</i> (2010)	frequency link uncertainty 1.2e-15 @ 1 day

- 1970ies and 1980ies some interest in VLBI
- since 1990ies more GPS
- interest in VLBI again in 2000ies

This study

- CONT08 and CONT11 sessions
- 15 days of continuous VLBI data
- Involving stations with IVS and IGS equipment
- Several stations have same clock for VLBI and GPS
- VLBI data analysis with CALC/SOLVE
 - Standard solution
 - 20 min clock estimates, constraints $5\text{e-}14$
- GPS data analysis with NRCAN-PPP
 - IGS final orbits
 - Kalman filter clock estimates every 60 s

Post-processing analysis

- VLBI
 - Removal of day-boundary jumps
 - Estimation of Allan deviation (ADev) on baselines
- GPS
 - Forming of baselines (differencing) and estimation of ADev
- VLBI versus GPS
 - Differencing VLBI and GPS solutions on common baselines
 - Trend difference and RMS calculation

CONT08

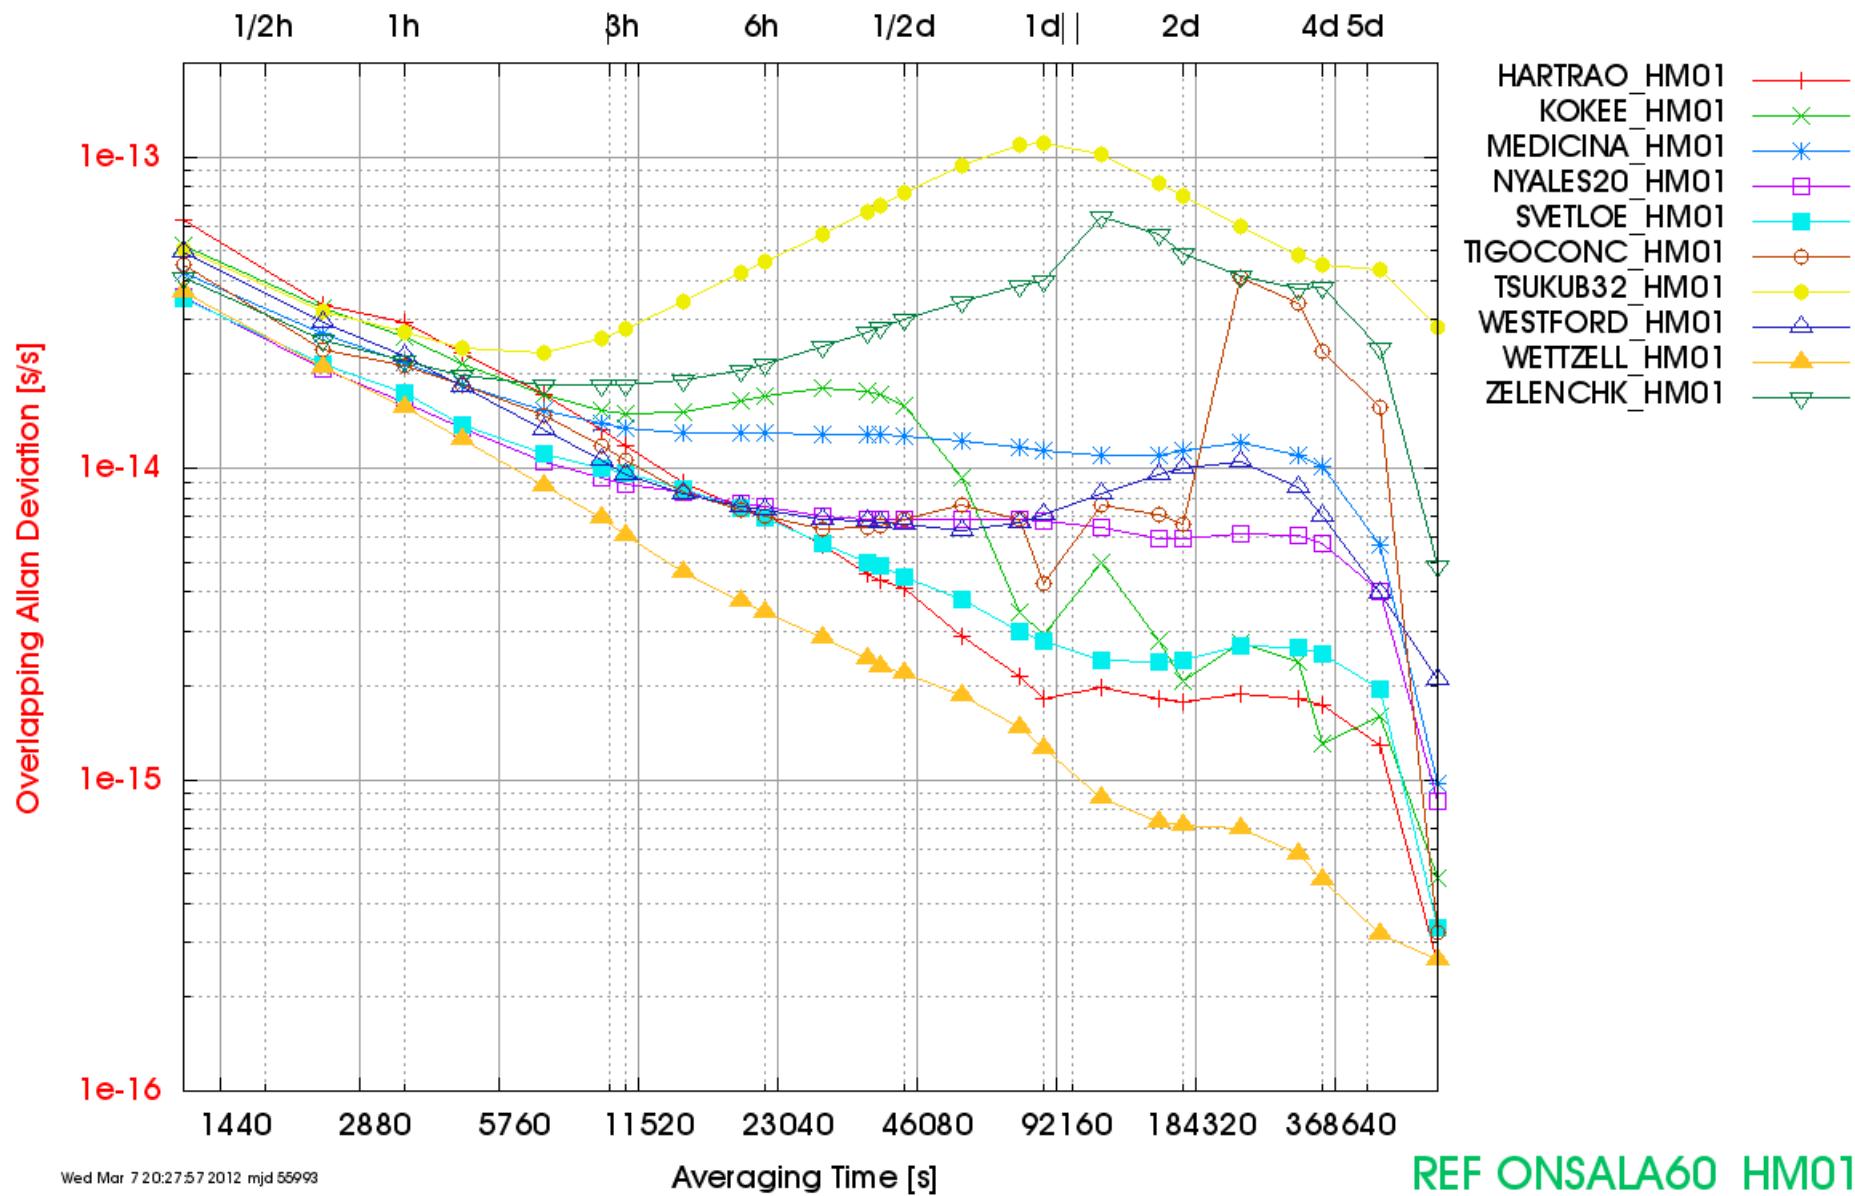

CONT08

- 2008, August 12-26
- 11 VLBI stations
- All of them operate also GNSS stations (IGS)
- 7 out of 11 stations share common clock for VLBI system and GNSS receivers

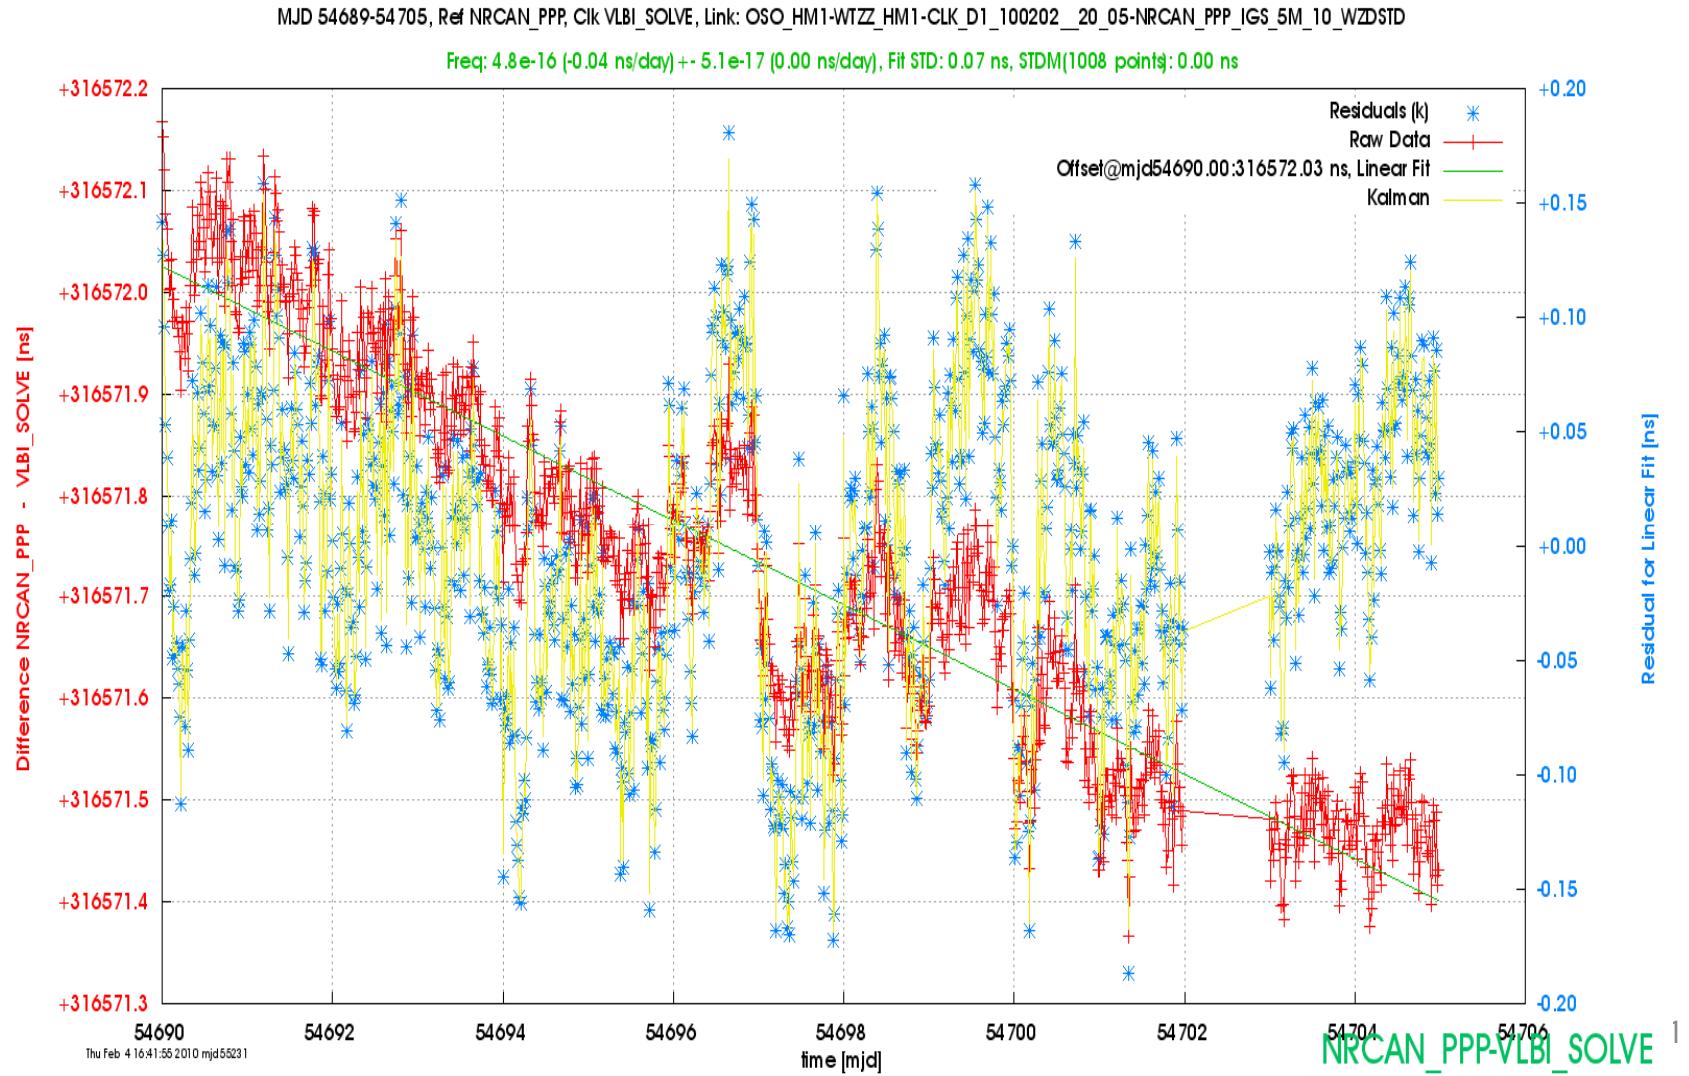

CONT08 equipment

IVS	IGS	H-maser	Common clock?
HARTRAO	HRAO	EFOS C	YES ☺
KOKEE	KOKB	Sigma Tau	YES ☺

CONT11

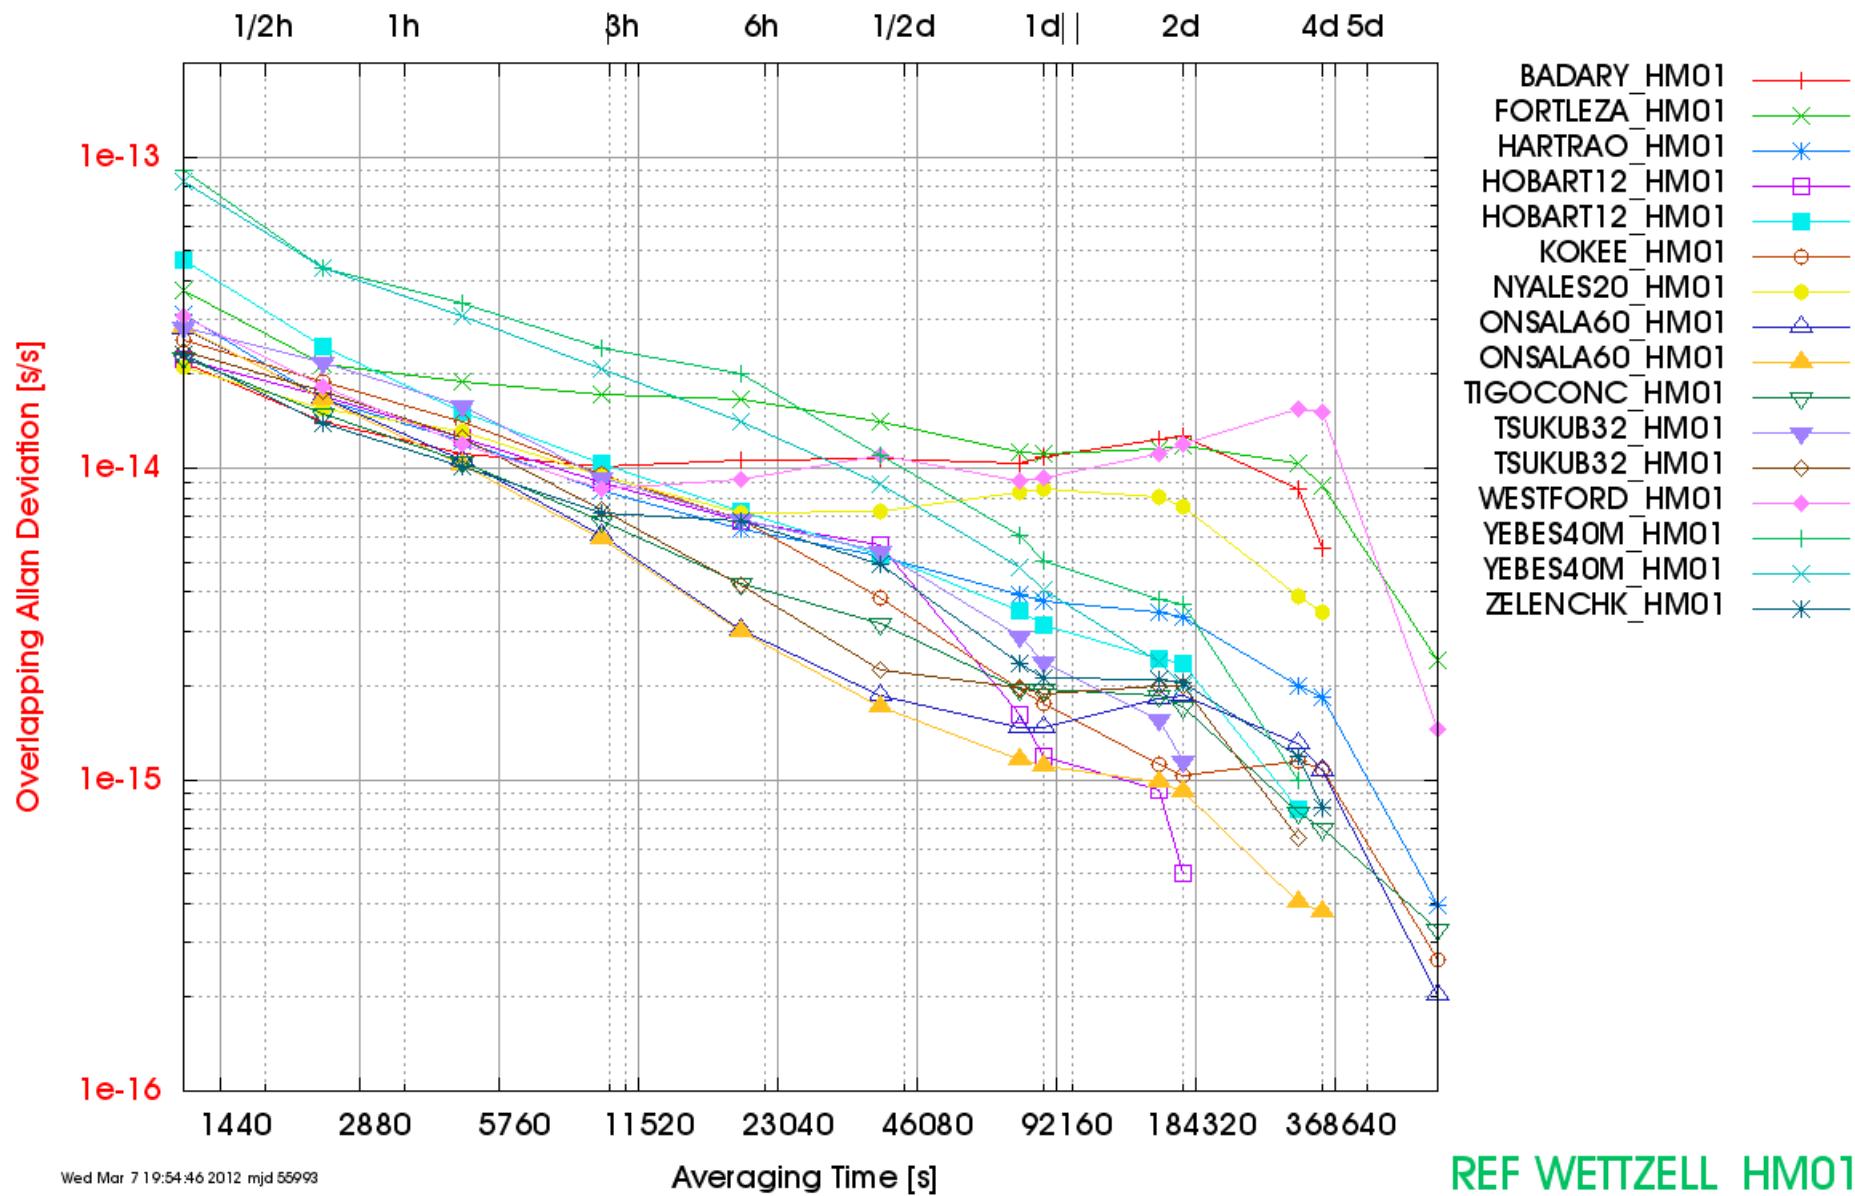

CONT11

- 2011, September 15-29
- 13 VLBI stations
- All of them operate also GNSS stations (IGS)
- 11 out of 13 stations share common clock for VLBI system and GNSS receivers

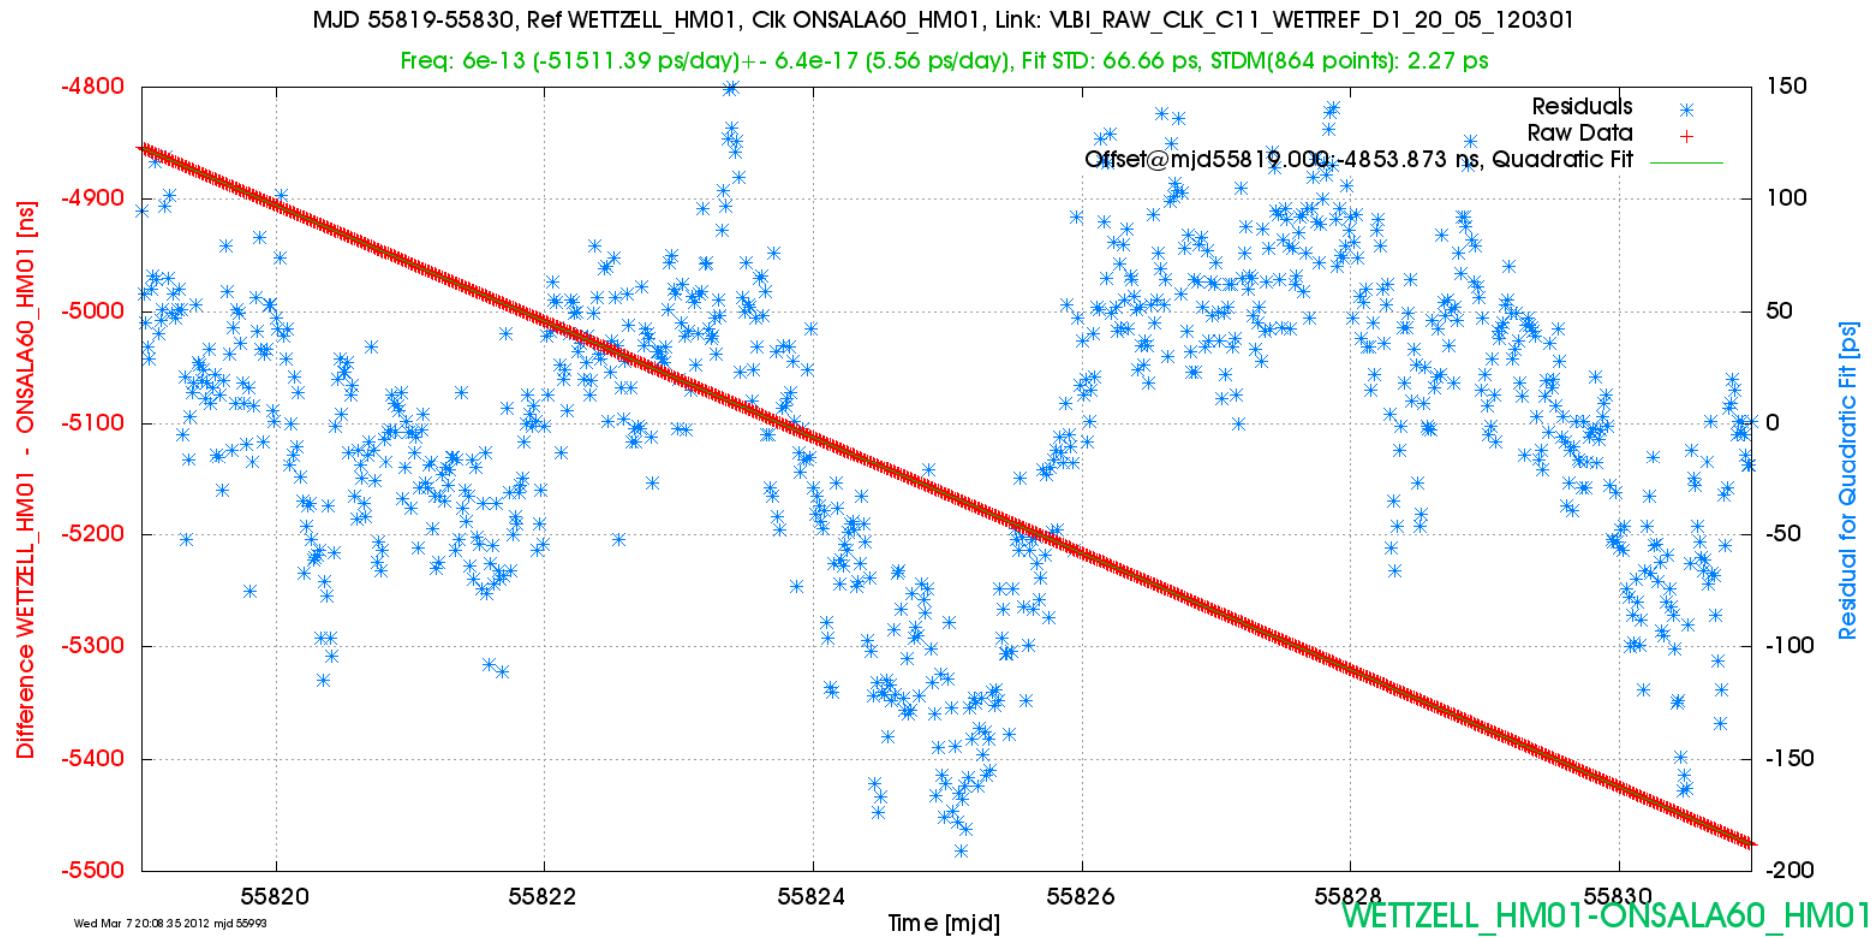

CONT11 equipment

ZELENCHK	2.1e-15	2.3e-15	No common clock	---

Conclusions

- VLBI can provide frequency transfer on the same level of accuracy as GPS methods
- Consistent results for CONT08 and CONT11
- Onsala-Wettzell baseline gives best results
- CONT11:
 - Allan Deviation $1.1\text{e-}15$ / $1.2\text{e-}15$ for VLBI / GPS
 - insignificant trend in the difference
- VLBI proves again to be an important independent method for frequency transfer

Outlook for VLBI2010

- Wettzell
 - Twin-telescope in 24/7 operation
 - Time laboratory with Cesium clocks and H-masers
 - Time and frequency from PTB Braunschweig
- Onsala
 - Hopefully twin-telescope in 24/7 operation
 - Time laboratory with Cesium clock and H-masers
 - Time and frequency from SP Borås
- Continuous time and frequency transfer between Germany and Sweden via VLBI might be possible
- Principle can be extended to intercontinental time and frequency transfer
