

KOKEE12M-KOKEE20M VLBI Tie and Mixed-mode Processing

A. Niell for the MIT Haystack VGOS group

Improving the ITRF

- VGOS network is expected to be more accurate than current legacy SX network
- Incorporation of the VGOS antennas in the existing reference frame is crucial
 - Benefit from long history of legacy observations
 - Improve the TRF accuracy and enable continuity.

KPGO GPS and VLBI histories

Strategies for linking VGOS and legacy

- Include in a legacy session those VGOS antennas that are capable of S-band reception
 - Obtain the positions of the VGOS antennas directly in the legacy frame
 - Improve the legacy networks by including more sites for each session
- Tie VGOS and legacy antennas at the same site with VLBI
 - Provides much more accurate position of the VGOS antenna in fewer sessions

Kokee Ties observations

- Kokee12m-Kokee20m
 - Four sessions in 2016 March (45 min to 22.5 hours)
 - 12m and 20m as scheduled antennas
 - Westford and/or GGAO tagged along
 - Phase cal turned off at 20m
 - Cable delay applied for both antennas
 - Required mixed-mode correlation and processing (same as will be used for R1/R4)

Kokee Ties analysis

- Geodetic solution with *nuSolve 0.6.4*
 - X-band only
 - 20m as reference station
 - Estimate the 12m position
 - Estimate the 12m clock as 30 min PWL segments
 - No atmosphere parameters estimated (L = 31m)
 - Both group and phase delay solutions obtained
- Compare to optical survey made by NGS

Group vs phase delay

Observing frequency: $\nu \approx 8 \text{ GHz}$

RMS bandwidth: $\Delta\nu \approx 0.25 \text{ GHz}$

Group delay error per scan $\propto 1/\Delta\nu$

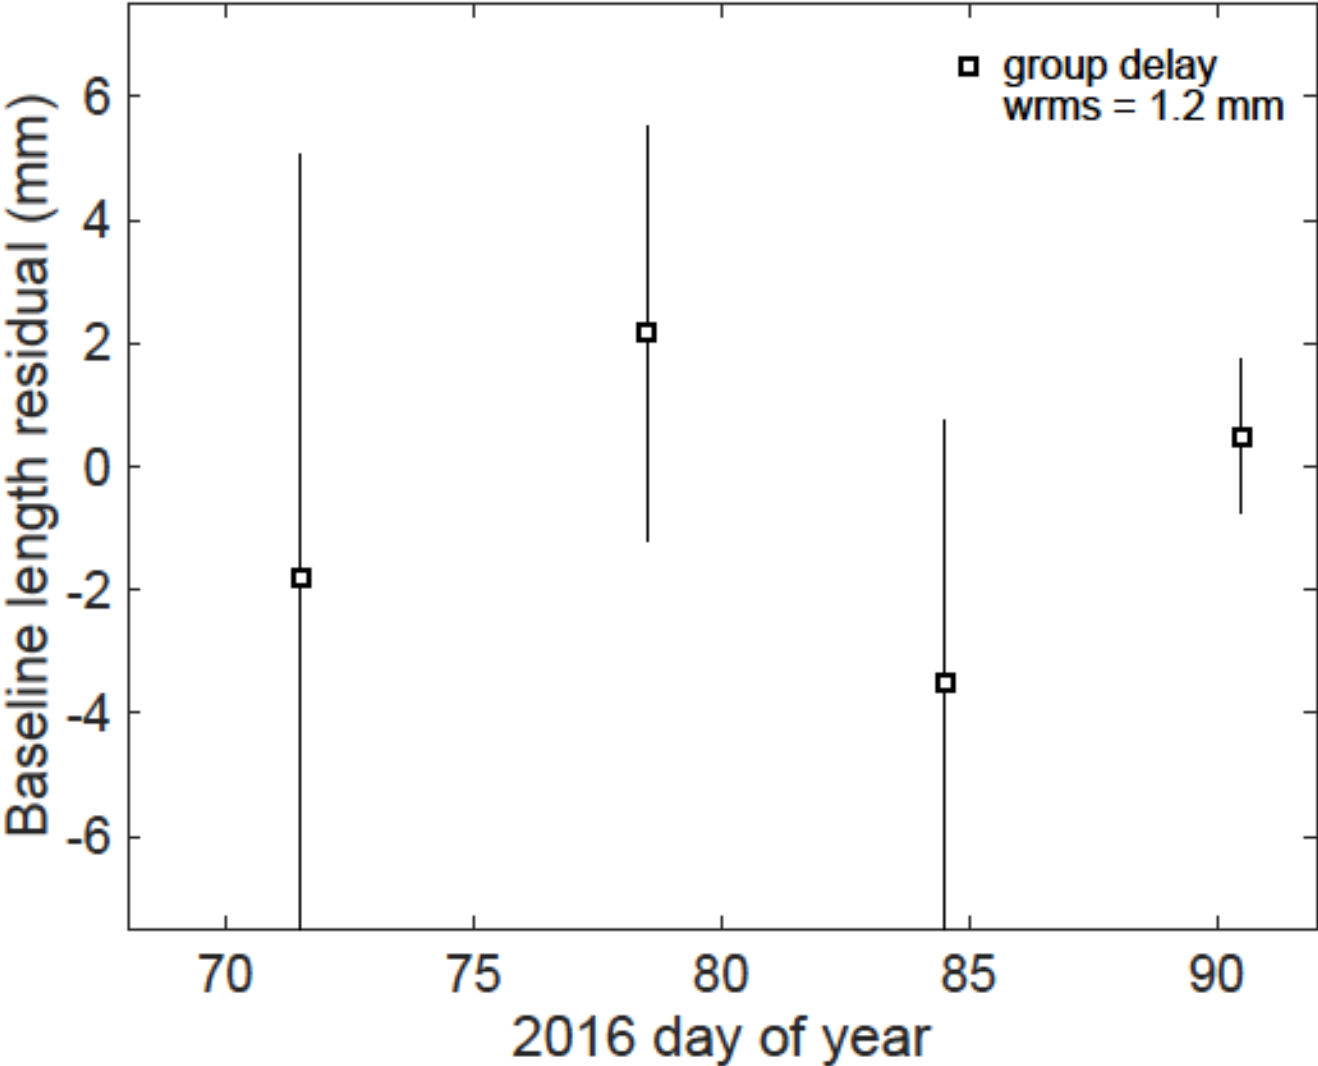

Phase delay error per scan $\propto 1/\nu$

So $\sigma(\text{phase}) \approx \sigma(\text{group})/30$

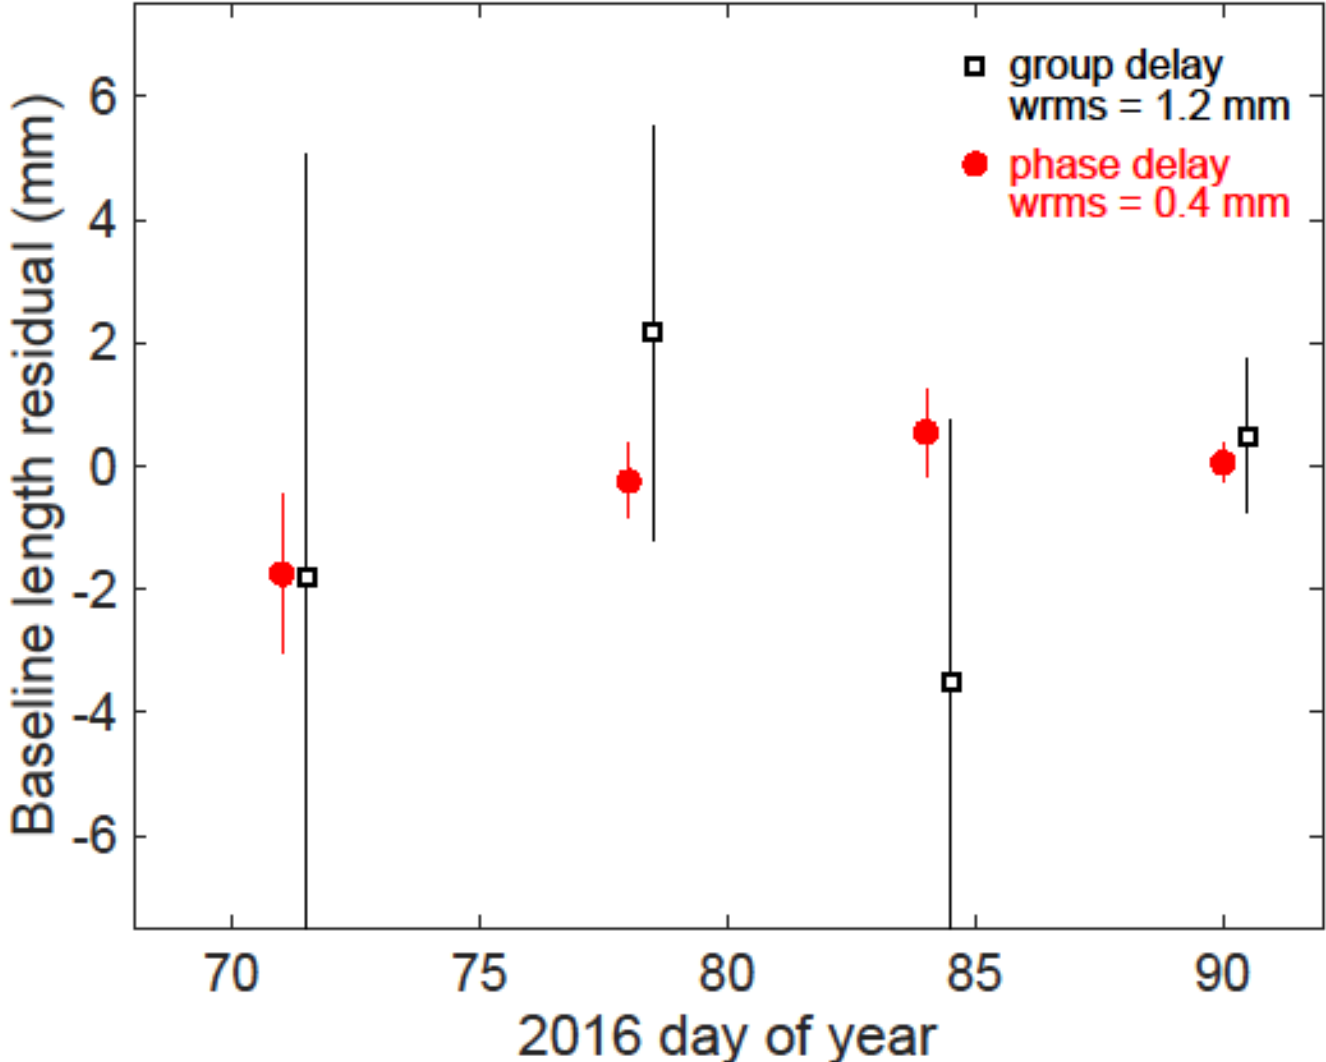

before additive noise is included, then

$\sigma(\text{phase}) \approx \sigma(\text{group})/3$

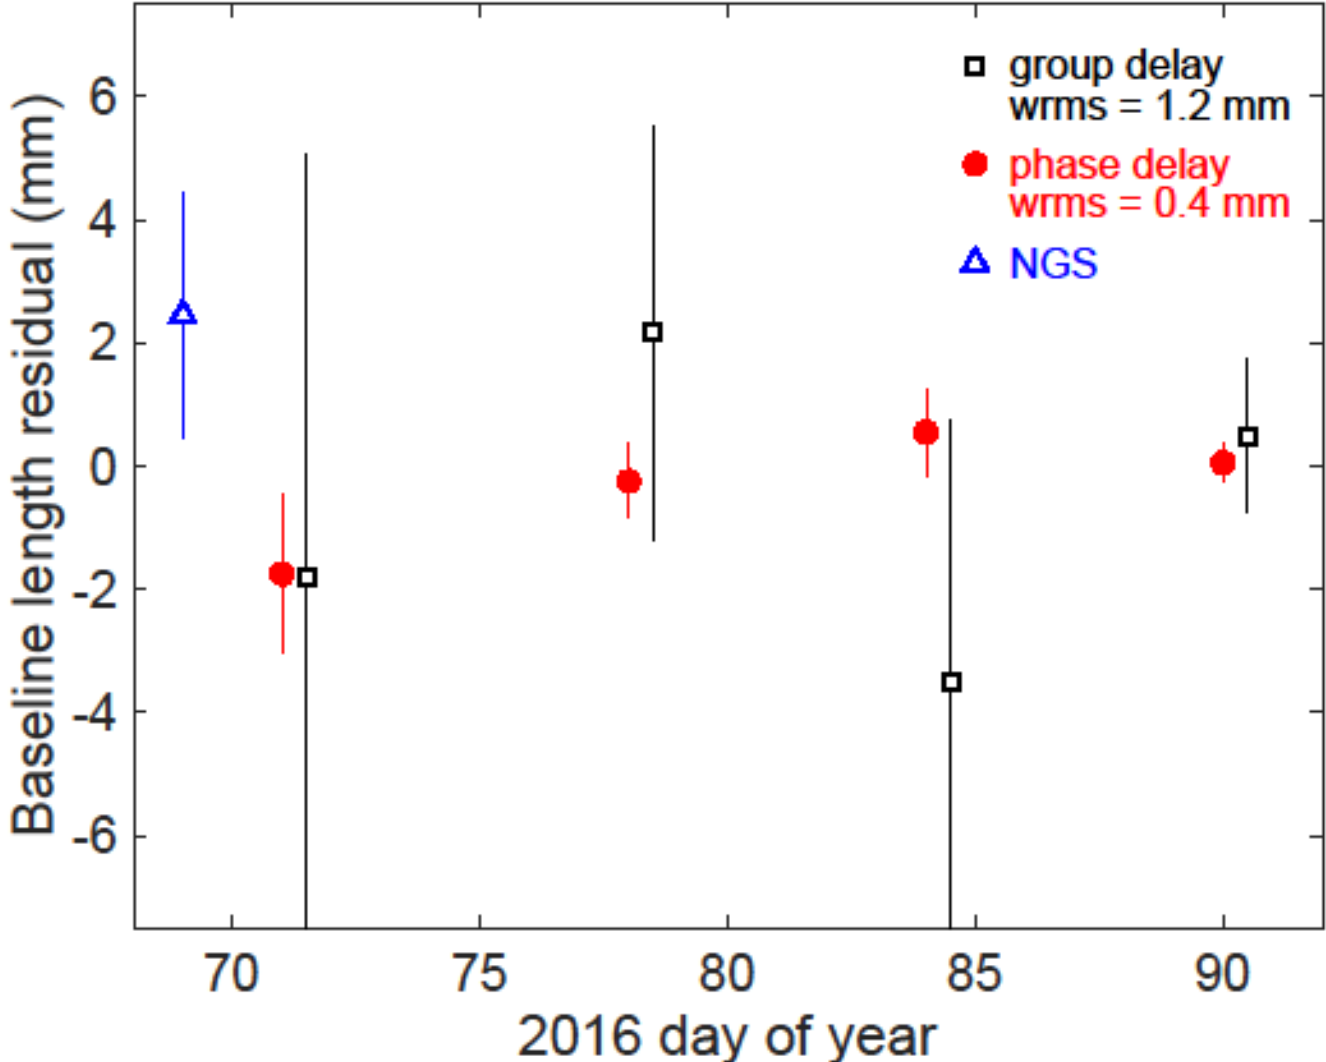

Repeatability

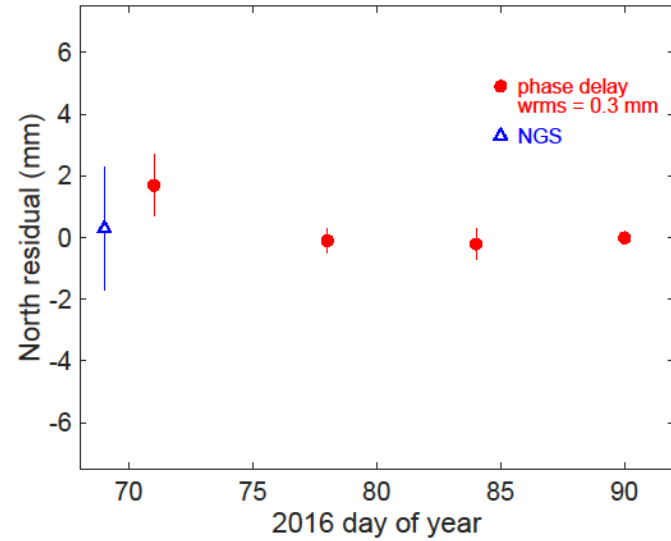

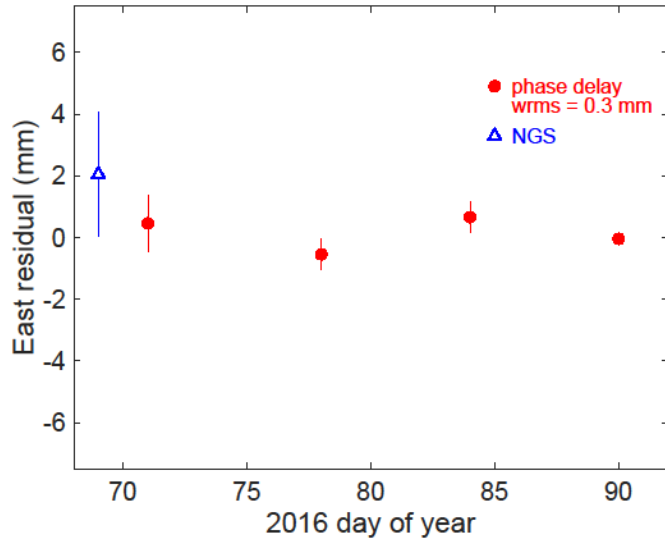

Repeatability

Repeatability

Repeatability

Future Kokee Ties Observations

- Local 12m-20m VLBI sessions
 - Receiver-box change is planned for the 20m that will allow broadband installation
 - Do additional VLBI tie sessions before and after box change
- Global S/X sessions
 - Verify and refine observing and correlation procedures
 - Include VGOS antennas in S/X sessions

Next actions

- Refine the analysis of the initial Kokee Ties sessions
- Complete the processing of RD1810
 - included GGAO12M, KOKEE12M, and WESTFORD as VGOS antennas
 - plus 6 legacy antennas
- Verify the processing procedures for mixed-mode sessions
- Schedule the next four Kokee Tie sessions

Mixed-mode observing

- Same-session observations with both S/X and broadband (VGOS) systems
- Frequencies
 - Global sessions
 - All antennas observe S/X
 - VGOS antennas may include another band
 - e.g. S/C/X₁/X₂
 - Local tie sessions
 - Utilize X-band only

Frequencies for mixed-mode: X-band

Summary

- Incorporation of the VGOS antennas in the existing reference frame is crucial for improving the TRF accuracy and for enabling continuity
- Have measured the vector between the colocated KPGO VGOS and legacy antennas with a repeatability of $<1\text{mm}$ in all components
- Procedures for mixed-mode observing and correlation are being developed and documented

Thank you.

Kokee12m and Kokee20m

Global session considerations

- The number of scans per hour will be limited by slow speed of the legacy antennas so global sessions will not achieve the temporal density of a VGOS-only session.
- Sensitivity at X-band may not be a problem for VGOS antennas, but may be at S-band due to RFI.
- Some VGOS stations will not be usable for global ties due to having a 3-GHz lower frequency cutoff.

Local ties considerations

- Proximity of the antennas potentially allows excellent full-sky coverage, but one antenna may shadow the other
 - Proximity of the antennas means ionosphere difference may be negligible; if so, use X-band only
 - Phasecal signals must be made non-interfering*
 - Turn phasecal off for one antenna
or
 - Offset the reference frequency for one antenna
 - Local RFI is common to all antennas at the site*
- * Use frequency notching in fourfit?
